[^0]
## Summary

- InfraRed Doppler instrument (IRD)
- A high-dispersion ( $\mathrm{R}=70,000$ ) near-infrared spectrograph for Subaru telescope
- Currently RV precision of $\sim 2 \mathrm{~m} / \mathrm{s}$ is achievable for $M$ dwarfs
- IRD-SSP
- Aiming at detecting earth-mass ( $\sim 1-3 \mathrm{M}_{\text {earth }}$ ) planets in habitable zone around late-M dwarfs, and unveiling planet population in wide range of mass and orbit around late-M dwarfs
- We expect to find $\sim 60$ planets in 60 sample stars by 5 -year ( 175 nights; 35 nights/year) survey.
- The first-two-year survey (19A-20B; 70 nights) is now officially approved.
- Observations have been conducted almost every month since this February.
- The first screening observation is now ongoing.

## Overview of the IRD instrument

# GJ 436 (M3V) 

## RV precision and stability

- Long-term monitoring of Barnard's star (GJ699; M4V)

|  | Total error | Internal error | Instrument + activity error |
| :---: | :---: | :---: | :---: |
| All data | $4.1 \mathrm{~m} / \mathrm{s}$ | $1.8 \mathrm{~m} / \mathrm{s}$ | $3.7 \mathrm{~m} / \mathrm{s}$ |
| Selected data | $2.7 \mathrm{~m} / \mathrm{s}$ | $1.8 \mathrm{~m} / \mathrm{s}$ | $2.0 \mathrm{~m} / \mathrm{s}$ |

## RV monitoring of planet-host stars

51 Peg

| Spectral type | G2IV | M3V |
| :---: | :---: | :---: |
| Planet mass ( $\left.\mathbf{m}_{\mathbf{p}} \mathbf{s i n} \mathbf{i}\right)$ | $0.466 \mathrm{M}_{\text {Jup }}$ | $21.36 \mathrm{M}_{\text {Earth }}$ |
| Period | 4.23 | 2.644 |
|  | $55.4 \pm 1.4$ (IRD) | $16.4 \pm 1.0$ (IRD) |
| $\mathbf{K}(\mathbf{m} / \mathbf{s})$ | $54.93 \pm 0.18$ (Birkby et al. 2017) | $17.38 \pm 0.17$ (Trifonov et al. 2018) |

## Purposes and goals of IRD-SSP

- Purposes
- Detecting earth-mass ( $\sim 1-3 M_{\text {Earth }}$ ) planets in habitable zone around nearby late-M dwarfs for future characterization
- Understanding planet formation and evolution (e.g. orbital migration) across snow line by unveiling planet distribution in wide range of mass and orbit around late-M dwarfs
$\square$ Goals
- Detecting a habitable-zone earth-mass planet around a late-M dwarf
- Unveiling distribution of
- earth-mass planets in $\mathrm{P}<100 \mathrm{~d}$
- super-earths in $\mathrm{P}<300 \mathrm{~d}$
- giant planets in $\mathrm{P}<1000 \mathrm{~d}$ across slow line

## Sample

$\square D<25 p c, M=0.08-0.25_{\odot}, J<11.5$, no Ha emission
$\Rightarrow 150$ stars were selected by low-resolution spectroscopy
$\square$ Double-line spectroscopic binaries and rapid rotators will be screened out by initial observations with IRD

- Best 60 stars will be selected for IRD survey

## Simulation

Slow migration (Type-I)

Fast migration (Type-I)

- We expect to find $\sim 60$ planets in 60 stars by 175-nights observations.
- The number of the expected planets depend on adopted theoretical models of planet formation and evolution.

## Summary of February - July 2019

- Allocated nights
- 2/18(2nd),19(2nd), $20(2 n d), 21(2 n d), 22(2 n d)$, 23(2nd), 24(2nd)
- 3/21(2nd), 22(2nd), 23(2nd)
- 4/17(full), 18(2nd)
- 5/18(1), 19(2), 20(2), 22(f), 24(1), 25(1), 26(1)
- 6/15(f), 16(15), 17(15),
$18\left(2^{\text {nd }}\right), 19\left(2^{\text {nd }}\right), 20\left(2^{\text {nd }}\right)$,
$21\left(2^{n d}\right), 26\left(2^{\text {nd }}\right)$,
- 7/11(1st), 14(2nd)
- Cumulative allocated nights
- 16.5 nights from S19A
- Rough success rate
- ~77\% (12.7/16.5nights)

Current progress of observation
observed
stars
stars observed once ..... 28
stars observed twice ..... 16
stars observed 3 times ..... 16
stars observe $>3$ times ..... 11

Numbers of Allocated nights and results in S19A

| Month | Feb. | March | April |
| :---: | :---: | :---: | :---: |
| Allocated | 3.5 nights | 1.5 nights | 1.5 nights |
| Observed | 0.5 nights | $\sim 1.5$ <br> nights | $\sim 1.5$ <br> nights |
| Monith | May | June | July |
| Allocated | 4 nights | 4.5 nights | 1 nights |
| Observed | 3.7 nights | $\sim 4$ nights | 1.5 nights |

## IRD Screening: Planet candidates?

- Moderately large ( $\sigma \sim 12 \mathrm{~m} / \mathrm{s}$ ) RV variations

## IRD Screening: AO images

- To check existence of visual companions in the images of IRD-FIM
- e.g. A companion with contrast ratio 1:7 = M4: M7
- Angular separation $=0.2^{\prime \prime}$, distance $17.7 \mathrm{pc} \rightarrow 3.5 \mathrm{AU}(\mathrm{P} \sim 13.5 \mathrm{yr})$

## IRD Screening: Spectral shape

From HR spectra we also check
Activity indicators (line shape, Pachen, He I Metallicity

double lines binary?

## IRD Screening: Spectroscopic binary

## IRD Screening: Target candidates

- NOT visual binary
- NOT spectroscopic binary
- Rotation is slow

Long term RV monitor to search for planets

- Small RV jitter

## Summary

- InfraRed Doppler instrument (IRD)
- A high-dispersion ( $\mathrm{R}=70,000$ ) near-infrared spectrograph for Subaru telescope
- Currently RV precision of $\sim 2 \mathrm{~m} / \mathrm{s}$ is achievable for $M$ dwarfs
- IRD-SSP
- Aiming at detecting earth-mass ( $\sim 1-3 \mathrm{M}_{\text {earth }}$ ) planets in habitable zone around late-M dwarfs, and unveiling planet population in wide range of mass and orbit around late-M dwarfs
- We expect to find $\sim 60$ planets in 60 sample stars by 5 -year ( 175 nights; 35 nights/year) survey.
- The first-two-year survey (19A-20B; 70 nights) is now officially approved.
- Observations have been conducted almost every month since this February.
- The first screening observation is now ongoing.
